

We claim:

1. A computer-readable medium having computer-executable instructions for performing steps for directing data transfer in a computer having a plurality of transport modules, the steps comprising:
 - receiving transport specific data from an application;
 - determining at least one of the plurality of transport modules with which the transport specific data is associated;
 - passing the transport specific data to said at least one of the plurality of transport modules; and
 - sending a transport independent interface to the application.
2. The computer-readable medium of claim 1 wherein the application is an OBEX application.
3. The computer-readable medium of claim 2 wherein each of the plurality of transport modules has a transport protocol.
4. The computer-readable medium of claim 3 wherein at least one transport protocol is one of an IrDA protocol, an IP protocol, and a Bluetooth protocol.
5. The computer-readable medium of claim 1 having further computer-executable instructions for performing the step of initializing the at least one transport

module.

6. The computer-readable medium of claim 5 wherein the at least one transport module is initialized by means of a transport interface.

7. The computer-readable medium of claim 6 wherein the transport interface comprises:

a command to initialize a transport;

a command to create a connection, the connection used for listening or for connecting to at least one other device;

a command to enumerate devices;

a command to enumerate properties; and

a command to close the transport.

8. The computer-readable medium of claim 7 further comprising computer-executable instructions for performing the step of providing a transport socket interface when a connection is created.

9. The computer-readable medium of claim 8 wherein the transport socket interface comprises:

a command to close the connection;

a command to listen for incoming connections;

a command to connect to at least one other device; and

0950753.060500

Al
cont

a command to enumerate properties about the connection.

10. The computer-readable medium of claim 9 wherein a transport connection interface is provided when one of the command to listen for incoming connections and the command to connect to at least one other device is executed.

11. The computer-readable medium of claim 10 wherein the transport connection interface comprises:

a command to close the connection;

a command to send data on the connection;

a command to receive data on the connection; and

a command to provide information about the connection.

12. A method to send at least one object between a first device and at least one of a second device comprising the steps of:

creating a primary interface;

finding the at least one of a second device ;

connecting to the at least one of a second device through a device interface; and

commanding one of a put command and a get command to transfer the at least one object between the first device and the at least one of a second device.

005000-03/0850

13. The method of claim 12 further comprising the step of disconnecting the at least one of a second device.
14. The method of claim 12 wherein the primary interface comprises:
 - a command to enumerate transports;
 - a command to enumerate devices; and
 - a command to register a service.
15. The method of claim 12 wherein the device interface comprises:
 - a connect command to connect to a device;
 - a put command to put an object on a device;
 - a get command to get an object from a device;
16. The method of claim 15 wherein the device interface further comprises:
 - a command to disconnect a connection
 - a command to abort a request; and
 - a command to set a path.
17. A method to provide a service to at least one device, the method comprising the steps of:
 - listening for an incoming connection;
 - receiving a service connection interface when an incoming connection is received, the service connection interface for listening for incoming command

requests;

listening for incoming command requests from the at least one device;
 receiving a command structure when an incoming command request is received that describes the incoming command request; and
 performing one of a read and a write operation in response to the incoming command request.

18. The method of claim 17 further comprising the steps of:

creating a primary interface having a register command to register a service;
 reading a transport data blob from a registry;
 passing the transport data blob to the register command; and
 receiving a service interface from the primary interface to listen for an incoming connection.

19. The method of claim 17 wherein the service connection interface comprises:

a command to accept an incoming connection;
 a command to close a connection;
 a command to listen for incoming connections; and
 a command to get the properties of a connection.

20. The method of claim 17 wherein the command structure comprises:

a pointer to an interface to enumerate headers that were received with a

005090" E E / 9 E 5 0

connect request;

a command to generate a response code; and

a stream interface to use to interface with a data stream.

21. The method of claim 20 wherein the stream interface comprises:

a command to read data from a stream;

a command to write data to the stream;

a command to read data from a specified file; and

a command to write data to the specified file.

22. A computer-readable medium having computer-executable instructions for

performing steps to provide at least one service to at least one device through at least one transport, the steps comprising:

providing a primary interface, the primary interface having a command to enumerate transports and to enumerate devices;

providing a transport interface for communicating with the at least one transport;

providing a service interface for determining when an incoming connection arrives; and

providing a device interface for communicating with the at least one device.

005000 "C5" 00500

generate transports;
generate devices; and
register a service.

medium of claim 22 wherein the
generate a transport;
create a socket;
generate a list of devices of a spe
generate properties required to cr
create a transport.

medium of claim 24 having furt
generate a transport socket interface if
medium of claim 25 wherein the
create a socket;
listen for incoming connections;
generate properties about a socket

and

a function to close a transport.

instructions for providing a transport socket interface if a socket is created.

- a function to close a socket;
- a function to listen for incoming connections;
- a function to enumerate properties about a socket; and

a function to connect to at least one of the at least one device.

27. The computer-readable medium of claim 26 having further computer-executable instructions for providing a transport connection interface if at least one of the at least one device is connected.

28. The computer-readable medium of claim 27 wherein the transport connection interface comprises:

- a function to close a connection;
- a function to send data on the connection;
- a function to receive data on the connection; and
- a function to enumerate properties about the connection.

29. The computer-readable medium of claim 22 wherein the service interface comprises:

- a function to listen for an incoming connection for the at least one service;
- a function to shut down an instance of the at least one service; and
- a function to set a password required to access the at least one service.

30. The computer-readable medium of claim 29 having further computer-executable instructions for providing a service connection interface if the incoming connection comes in.

a function to instruct the stream to use data from a specified file; and
a function to instruct the stream to write data to the specified file.

35. The computer-readable medium of claim 22 wherein the device interface comprises:

a function to connect to a device;
a function disconnect the device;
a function to send data to the device; and
a function to get data from the at least one service.
